

In the Abstract:

ABSTRACT OF THE DISCLOSURE

According to a method of measuring a thickness, to measure a thickness  $d$  of a liquid crystal layer  $[[11]](11)$ , a property of reflected light is utilized, in that the light returns maintaining the same polarizing plane as that of an entrance when a polarizing plane-maintaining condition is satisfied in which a difference in optical path lengths between an ordinary ray and an extraordinary ray of the reflected light is a sum of an integer multiple of the wavelength and a half-wavelength or an integer multiple, to find a wavelength at which the polarizing plane-maintaining condition is satisfied. A reasonable  $\Delta n \cdot d$  is thereby found. This is performed for a plurality of wavelengths to find a relational expression of a wavelength and  $\Delta n \cdot d$ . A known combination of a wavelength  $\lambda$  and  $\Delta n$  is assigned to the relational expression to find  $d$ .
